

MANUFACTURING SITE LEVEL

Manufacturing Site Level plug-in enables ARCUS[®] SIM users to gather detailed information about each of their supplier's sites. This enables organisations to approve suppliers on a company and site level, providing quality and technical professionals with the tools they need to efficiently execute their quality management system.

ADVANTAGES

Integration with the on boarding process

The Manufacturing Site Level plug-in enables organisations to request the information that matters to them at a company level and an individual manufacturing site level.

Each site can then be approved, approved with conditions, or rescinded based on the information uploaded. This ensures that each product meets the user's exact requirements and is the same regardless of the site they are supplied from.

Auditable

All information within the system is auditable, allowing users to confidently demonstrate

to internal and external stakeholders, such as auditors, the steps that have been taken when carrying out comprehensive checks on suppliers. This includes any corrective actions that have been taken to mitigate the associated risks.

Reduce manual administration

All the information required to accredit each site through a granular and systematic methodology is provided by the supplier directly via tailored online questionnaires. This information is stored in the cloud, alongside the ARCUS[®] SIM record, and removes the need for multiple and manual systems.

Better visibility

The dashboard provides a 360° view of all the information contained on each supplier. This means users are fully informed of which manufacturing sites have been approved to provide products. By doing so, this removes silos of information and delivers reassurance across the organisation that the appropriate checks have been conducted and are visible.

FEATURES

Custom forms

By using the Manufacturing Site Level plug-in users can request specific information for each site based on their quality systems, including: BRC, Kosher, Halal and Organic certifications, HACCP and food safety information. The number and type of questions asked can be different for each site depending on the products supplied and their locations.

Automatic reminders

Reminders can be set against every document uploaded, meaning that site specific expiry dates for certifications will automatically be requested in addition to company level information. This ensures that each site remains compliant and that the relevant departments can take actions to manage each site's approval efficiently.

Custom reporting and scoring

Scoring can be assigned to each question, or a selection of the questions, and subsequent information can be requested during the initial questionnaire completion or via workflow after review by technical or quality professionals.

The Manufacturing Site Level plug-in enables printable site data sheets to be created and downloaded. As well as this, custom reports, at single or multiple site levels, can be created quickly and easily.
