

SUPPLIER AUDIT

Supplier Audit is an advanced plug-in for ARCUS[®] SIM which makes the process of recording, managing and scheduling audits against a supplier a simple and efficient process, providing quality and technical professionals with complete insight over the supply base.

ADVANTAGES

Fully auditable

All supplier audit information is stored centrally in the cloud, and is easily accessible by all relevant stakeholders. This improves efficiency, creates better visibility and ensures all audit information is stored alongside the supplier's complete SIM record.

Reduce manual administration

By automating processes and storing audit information and documents online, this removes the need for manual systems that can be subject to inaccuracy and human error.

Consistent management of data

Supplier audit information is uploaded and stored with the complete SIM record, creating one consistent process and system for collecting and managing various types of supplier information.

Demonstrate due diligence

Supplier Audit allows users to instantly recall and retrieve audit data when required, which proves they have done their due diligence. This can help protect company brand and reputation against supply chain risks.

FEATURES

Custom audit forms

Fully configurable supplier audit forms tailored to business requirements allow users to gather varied levels of information, ensuring only the most relevant data is collected from suppliers.

Audit reminders

Customisable automated alerts and reminders can be set against key milestones, such as audit due dates, to ensure they are not missed.

Auto scoring

Suppliers are scored depending on their responses to the questionnaires during the onboarding process. This enables users to easily identify high and low risk suppliers and their sites, then efficiently select those that need to be audited.

Third party access

Third parties, such as external auditors, are given access to the Supplier Audit record, enabling them to upload and amend audit information, meaning there is no need to re-key data.

Attach documents

The Supplier Audit plug-in allows suppliers to attach important audit documents within their SIM record, and then stores these centrally in the cloud.

Custom reporting functionality

Create and share custom audit reports at the click of a button, which can then be easily exported to standard formats such as CSV and Excel.
